

Xamime Integration - Type 2

Detailing the methods of integrating Xamime into existing networks

A standard single mail server encompassing all functions...

...with the inclusion of an additional Xamime box as a prefiltering system

The two box (Xamime on a dedicated prefilter) solution is ideal for situations where the existing SMTP server cannot support Xamime (ie, Windows Exchange) or where it is preferred to not disturb an existing stable installation.

Advantages:

- Does not disturb existing SMTP server configuration
- Provides a MX backup server in case the main server needs to be taken down
- Does not impose a greater load (from filtering) on the existing server
- System can be reverted to a pre-Xamime state simply by changing the MX records

Disadvantages:

- Requires an additional server
- End clients are required to send their outbound emails via the Xamime server (if filtering is to be performed on outbound emails)
